

Manual

For mounting the Baader Dovetail Bar Z and V at Celestron C8, C 925 and C 11 SC- and HD-Optics

There are FOUR holes on the back end of the C8 tube – the small dove tail bar that is mounted on the tube now uses the INNER two holes. Our dove tail bar uses the two OUTER holes. You just have to remove the headless set screws which are sealing these outer holes and prevent dust from entering into the tube. Then you should seal the inner two holes with the same screws and mount our dove tail bar with the screws that were included in the shipment. Our bar will be longer than the tube and it can be fastened, so that it will be longer on the REAR end of the C8 tube – or – it also can be mounted in reverse mode, so that the bar is longer on the FRONT side of the C8 tube (if you would like to mount a long guide scope on top of the tube...).

We think, our system is quite universal and would fit all needs of the most demanding astrophotographer – except for the "cosmetics".
